

The augmented rear end has a firm but natural feel, about like the feel of a person has who been working out with weights or exercising hard for many years. Moreover, you actually do not sit on the implant because it is placed somewhat higher than the bones on which you actually sit.

BODY IMPLANTS

Body implants are used as muscular enhancement procedures employing silicone arm implants(deltoid, biceps and triceps), calf implants, and pectoral implants.

Pectoral Implants- Even with frequent exercise, men sometimes find that they are still unable to achieve the chest development that they desire. Pectoral implants shape, enlarge, and firm the chest muscles, helping one attain the look they want while still allowing a natural appearance when the pectoral muscles are either flexed or relaxed.

Deltoid, Biceps and Triceps (Arm) Implants-These implants can create muscular definition and increased mass/fullness in the upper arm area. This procedure is specifically useful for those men and women who, even after extensive muscular conditioning, can't achieve the upper arm toning they desire. Bicep Implants and Tricep Implants are also recommended for those unique instances when an injury has occurred and muscle mass augmentation is needed to achieve normal balance.

Calf Implants- Many people are dissatisfied with the shape/size of their calf muscles to the point that they avoid wearing garments that expose their legs. In these instances, even intensive exercise may not significantly enlarge the calf muscles, particularly in relation to one's larger thigh muscles.Calf implants enhance the shape and size of the calf muscles by being placed in pockets overlying the existing gastrocnemius muscles.

Dr. Mohan Thomas

Diplomate- American Board of Cosmetic Surgery (ID)

The Dr. Mohan Thomas Aesthetics is a World Class stand alone Surgical Facility. The design is geared to maintain absolute privacy, patient safety with the latest in Technology, sterilization, dedicated recovery rooms and well appointed step down rooms.

Our team of Super specialists provide all feel good services under one roof and headed by Dr. Mohan Thomas, one of the Top Cosmetic Surgeons in the World. He is American trained and Board Certified in Cosmetic Surgery.

His column in "Femina", for over a decade has over 6.5 lakh fans.

Dr. Mohan Thomas also has an 'Expert Column' in Bombay Times.

His book " Picture Perfect" launched by Bollywood Actor Tisca Chopra is very comprehensive and covers all aspects of Cosmetic Surgery and Medicine and is available at all leading book stores and online.

He is a Leading Academic Contributor to the World's Best Scientific Journals.

IMPLANTS

INDIA'S BEST is also the WORLD'S BEST

- Breast Implants
- Facial Implants
- Buttock Implants
- Body Implants

We've supposedly heard it all before, or some variation of it . . .
"Men like women with breasts, butts, athletic with an hour-glass figure.
Women like tall men, athletic with broad shoulders."

Is it important? Perhaps. Perhaps not.

Humans who do not have well-endowed body parts as popularized by media and seconded by scientific studies have a lack of confidence and feel low. They compare themselves with their siblings, friends and colleagues and would give anything to have them enhanced.

Human body parts can be augmented by the use of Medical grade Implants. These are non-functional and only help in improvement of a certain body part.

BREAST IMPLANTS

Breast implants are medical devices that are implanted under the breast tissue or under the chest muscle to increase breast size (augmentation) or to rebuild breast tissue after mastectomy or other damage to the breast (reconstruction). They are also used in revision surgeries, which correct or improve the result of an original surgery.

WHAT ARE THE DIFFERENT TYPES OF BREAST IMPLANTS?

The implants are classified according to the composition, viz. saline filled and cohesive silicone-gel filled. The cohesive silicone-gel filled implants are the most preferred by cosmetic surgeons all over the world. The gel in these implants does not leak out even if there is a puncture in the implant. Leaking silicone from the older generation implants had disastrous implications, which are unheard of in case of the cohesive gel implants. Another classification is based on the shape that includes round or anatomic (tear drop) implants and these are firmer (Cohesive III). The anatomic implants take the shape of mature breasts, whereas the round implants give an overall lift to the breasts. The implants are also differentiated by the type of the shell being either smooth or textured. The surgeon guides you in the selection of an implant. The implants must be USFDA approved.

WHAT ARE "GUMMY BEAR" IMPLANTS?

"Gummy Bear Implants" is a term for describing an implant that retains its shape. The other terms used for these type of implants are "cohesive", "form-stable", or "highly cohesive" breast implants.

It's important to note that the US FDA approved breast implants that we use are different from all others-inside and out. During independent laboratory testing, gel implants were found to be strong, yet they remain remarkably soft to the touch, as is reported by the US FDA.

FACIAL IMPLANTS

These are specially formed solid materials compatible with human tissues, designed to enhance or augment the physical structure of your face.

The precise type and size of facial implants best suited for you requires an evaluation of your goals, and the features you wish to correct.

If you are bothered by a small chin, weak jaw, or lack of facial contour, surgery with facial implants may benefit you.

While any area of your face can be augmented with implants, the cheek or malar area, chin, and jaw are the most common sites for facial implants.

CUSTOMIZED FACIAL IMPLANTS

There are times during cosmetic facial contouring when "off the shelf" facial implants do not provide the optimal solution for correcting a facial abnormality or meets the needs of the patient. For this we undertake a procedure wherein extremely accurate and anatomically custom-designed facial implants are fabricated and used.

This process begins with a CT scan of the anatomical area where improvement is sought. A computerized – 3 dimensional image is taken and an exact life size model of the skeletal structure is created. This model is then used to facilitate production of an extremely accurate implant that will exactly correct the contour deformity. The surface of the implant to be in contact with the bone is extremely precise so that it locks into the bone providing long-term stability.

The advantage of this procedure is that a specific aesthetic goal can be achieved where a "off the shelf" implant will not be able to achieve the desired results. Moreover no reshaping of the implant is needed during the surgery thus reducing the surgery time as well as adds longevity to the result. The outcome is absolutely natural with no visible or palpable demarcation between the edge of the implant and the bone.

BUTTOCK IMPLANTS

In order to achieve a curvier derriere, many individuals choose to undergo buttock implant surgery. Gluteal implants can improve the shape of patients' buttocks and not only make them look better, but also give more self-confidence and be more approachable, thanks to the shapely new figure. Underdeveloped and irregularly shaped buttocks can be enhanced and made attractive through gluteal augmentation. Women often ask for buttock implants when they are thin and usually these women don't have enough body fat to spare for a butt enhancement procedure known as fat grafting or fat transfer.
